Genesys Experience Unit Calculator

User Guide

Version 3.0.0 · November 2026

The summary tiles at the top of the calculator show the monthly total and estimated cost.

1. Introduction

The Genesys Experience Unit Calculator estimates how many Genesys **Experience Units** a customer will need each month. Experience Units are also known as AI tokens: **1 Experience Unit = 1 token**.

You describe the customer's automated voice and digital interactions and the other AI capabilities they plan to use. The calculator converts each one into Experience Units, totals them, and shows the estimated monthly cost.

This guide walks through each part of the calculator, explains every input, and lists the consumption rate behind each calculation.

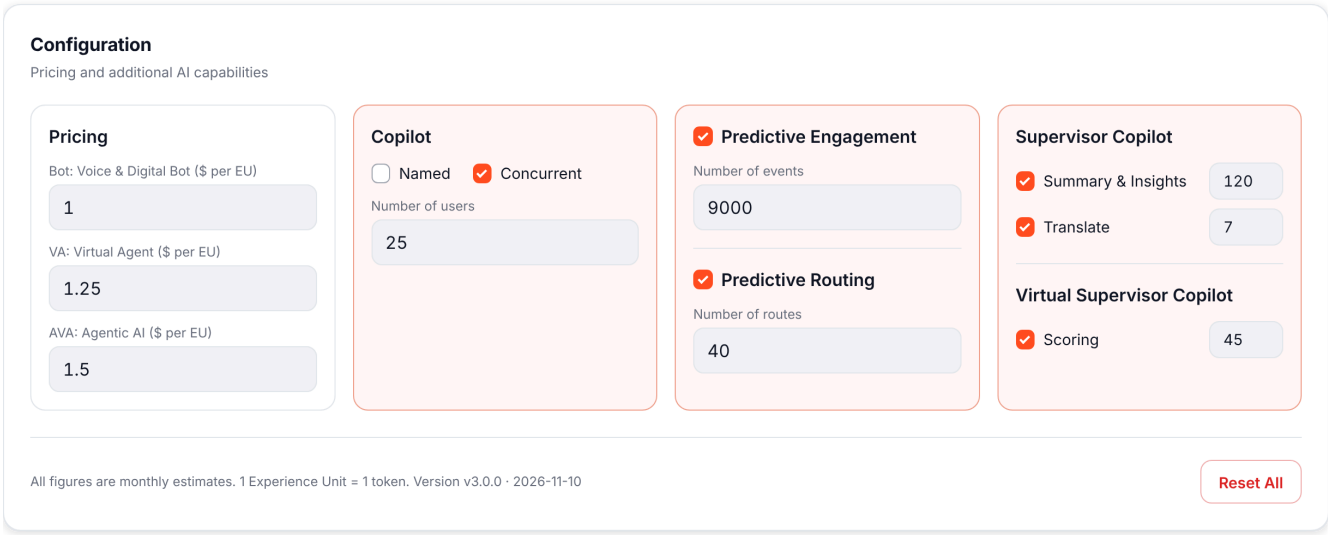

2. The Layout at a Glance

- **Header:** the calculator name and version, a *User Guide* button that opens this document, and a light/dark mode toggle.
- **Summary tiles:** Total Experience Units, Estimated Cost, and the Distribution switch.
- **Experience Unit Breakdown:** a chart and results panel showing where the Experience Units go.
- **Voice Mix** and **Digital Mix:** tables for each automated interaction, each with a cost comparison chart beside it.
- **Configuration:** pricing and the additional AI capabilities.

All figures are monthly. Results update as soon as you change a value.

3. Configuration

This section sets pricing and turns on the AI capabilities that consume Experience Units outside the voice and digital mix.

Configuration. A panel is highlighted when its capability is turned on.

Pricing

Each AI type has its own price per Experience Unit. Each price defaults to $1.00 and can be changed.

- **Bot ($ per EU):** the price of Voice Bot and Digital Bot Experience Units.
- **VA ($ per EU):** the price of Virtual Agent Experience Units, voice and digital.
- **AVA ($ per EU):** the price of Agentic AI (Agentic Virtual Agent) Experience Units, voice and digital.

These prices set the Estimated Cost, the AI Cost Comparison charts, and which AI type the Lowest Cost view picks.

> Experience Units from Copilot, Predictive Engagement, Predictive Routing, Supervisor Copilot and Virtual Supervisor Copilot count toward Total Experience Units but are not included in the Estimated Cost.

Copilot

Choose one licensing model. Checking one box clears the other.

- **Named:** a named user model. `40 EUs per user per month`
- **Concurrent:** a concurrent user model. `60 EUs per user per month`
- **Number of users:** the total number of named or concurrent users.

Predictive Engagement and Predictive Routing

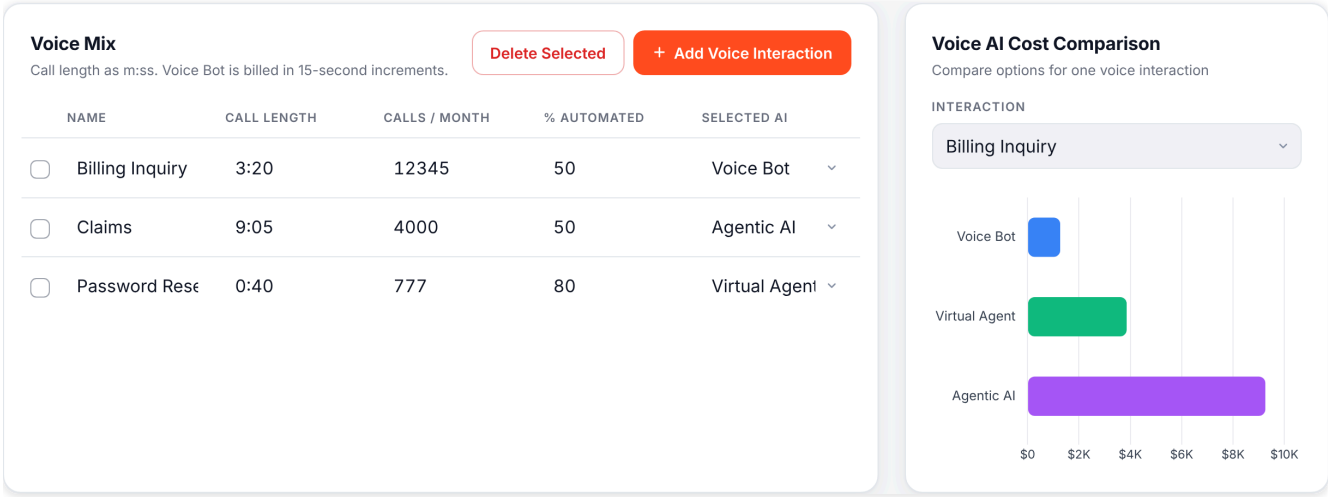

- **Predictive Engagement:** check the box and enter the number of events processed per month. 1 EU = 4,000 events
- **Predictive Routing:** check the box and enter the number of interactions routed per month. 1 EU = 17 routed interactions

Supervisor Copilot and Virtual Supervisor Copilot

- **Summary & Insights:** the number of conversation summaries or insights to generate. 1 EU = 50 summaries or insights
- **Translate:** the number of agent and customer interactions to translate. 1 EU = 2 translations
- **Scoring** (Virtual Supervisor Copilot): the number of interactions to score or evaluate automatically. 1 EU = 20 evaluations

4. Voice Mix

Add a row for each type of automated voice interaction with *Add Voice Interaction*. To remove rows, tick their checkboxes and click *Delete Selected*.

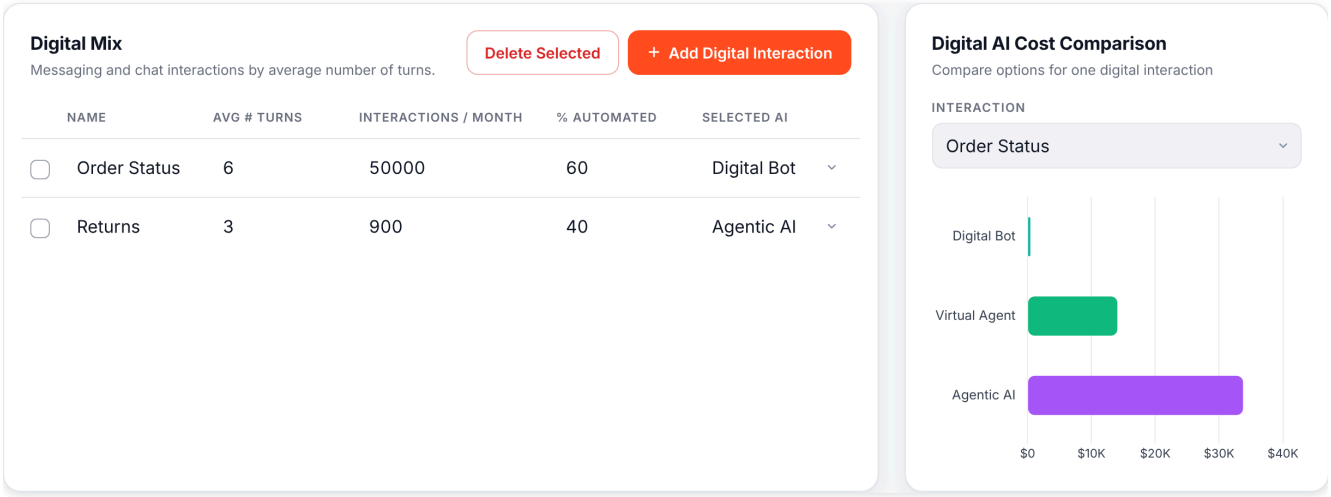

Voice Mix with the Voice AI Cost Comparison chart beside it.

- **Name:** a descriptive name, for example "Billing Inquiry" or "Password Reset".
- **Call Length:** the average handle time in m:ss format, for example 3:20.
- **Calls / Month:** the number of calls of this type each month.
- **% Automated:** the share of these calls you expect AI to handle fully. New rows start at 50%.
- **Selected AI:** the AI type that will handle the automation.
  - **Voice Bot** (Bot price): billed on minutes used, rounded up to the next 15 seconds per call. 1 EU = 17 minutes
  - **Virtual Agent** (VA price): billed per automated session. 1 EU = 2 sessions

- **Agentic AI** (AVA price): billed per automated session, for more complex, goal-oriented tasks. 1 EU = 1 session

5. Digital Mix

Add a row for each type of automated digital interaction, such as chat or messaging, with *Add Digital Interaction*.

Digital Mix with the Digital AI Cost Comparison chart beside it.

- **Name:** a descriptive name, for example "Order Status".
- **Avg # Turns:** the average number of exchanges in an interaction. One customer message plus one bot response is one turn.
- **Interactions / Month:** the number of interactions of this type each month.
- **% Automated:** the share of these interactions you expect a bot to handle fully.
- **Selected AI:** digital usage is measured in bot flows, where 1 bot flow = 8 turns.
  - **Digital Bot** (Bot price): 1 EU = 51 bot flows (408 turns)
  - **Virtual Agent** (VA price): 1 EU = 2 bot flows (16 turns)
  - **Agentic AI** (AVA price): 1 EU = 1 bot flow (8 turns)

6. Understanding the Results

Experience Unit Breakdown: the chart on the left, and totals and unused capacity on the right.

Distribution: Selected or Lowest Cost

- **Selected** uses the AI type you chose for each row in the Voice and Digital Mix.
- **Lowest Cost** picks the cheapest AI type for each row automatically, using the Bot, VA and AVA prices, which helps you find savings.

> In the Lowest Cost view, voice calls of 8:30 or longer are always counted as Virtual Agent.

Experience Unit Breakdown chart

The bar chart shows the Experience Units needed for each AI type and capability that is in use.

Results panel

- **Experience Units:** the Total Experience Units, and the Estimated Cost: Bot Experience Units at the Bot price, plus Virtual Agent Experience Units at the VA price, plus Agentic AI Experience Units at the AVA price. These also appear in the summary tiles, with the prices in use shown under the Estimated Cost.
- **Unused Capacity** (Selected view only): each Experience Unit buys a block of usage, such as 17 Voice Bot minutes. This shows what is left over in the blocks you pay for. Values of 1 or more are highlighted in red, because that usage is already paid for and could absorb more automation at no extra cost.

> Example: 18 minutes of Voice Bot use needs 2 Experience Units, which cover 34 minutes. Unused Capacity shows 16 minutes.

7. AI Cost Comparison Charts

The Voice AI Cost Comparison and Digital AI Cost Comparison cards compare the AI options for a single interaction.

1. Choose an interaction from the *Interaction* menu on the card.
2. The chart shows the monthly cost of handling that interaction's automated volume with each AI type, at the Bot, VA and AVA prices.

8. Other Controls

- **Reset All:** click once, then click *Confirm Reset?* within 3 seconds to clear every input and restore the default prices.
- **Light/dark toggle:** the calculator follows your system theme. The toggle overrides it, and your browser remembers the choice.
- **Version:** shown next to the title and in the footer. The CHANGELOG in the project repository lists the changes in each version.

9. Consumption Quick Reference

CAPABILITY	UNIT OF MEASUREMENT	PER 1 EXPERIENCE UNIT	PRICE
Voice Bot	Minutes of use (15-second increments)	17 minutes	Bot
Virtual Agent (voice)	Voice sessions	2 sessions	VA
Agentic AI (voice)	Voice sessions	1 session	AVA
Digital Bot	Bot flows (8 turns each)	51 bot flows	Bot
Virtual Agent (digital)	Bot flows (8 turns each)	2 bot flows	VA
Agentic AI (digital)	Bot flows (8 turns each)	1 bot flow	AVA
Copilot (Named)	Users per month	40 EUs per user	Not priced
Copilot (Concurrent)	Users per month	60 EUs per user	Not priced
Predictive Engagement	Events	4,000 events	Not priced
Predictive Routing	Routed interactions	17 interactions	Not priced
Summary & Insights	Summaries or insights	50	Not priced
Translate	Translations	2 translations	Not priced
Scoring	Evaluations	20 evaluations	Not priced

Copilot is counted per user rather than per block of usage: each user adds 40 (Named) or 60 (Concurrent) Experience Units per month. "Not priced" capabilities count toward Total Experience Units but not the Estimated Cost.
